

NurseMate™ ASAP Supplements A *Healthy Start for Puppies*

Born with relatively no immune system, newborns depend on colostrum from their mothers to transfer the first immune factors to their systems. During the early stages of development it is imperative the proper amount of colostrum be given to the newborn. A weak immune system in the pup's first hours can have a significant influence on the rest of the animal's life.

Even nature is not always perfect; often there may not be an adequate amount of colostrum available for a full litter. When this happens some or even all the litter will suffer due to competition and poor feeding. That's where NurseMate™ comes in. NurseMate™ gives the newborn the energy to aggressively nurse as well as provides an alternative source of colostrum with the essential proteins the newborn needs to get the right start.

Sluggish Appetite

Puppies will often stop eating when suffering from mild gastrointestinal infection. Another reason for a sluggish appetite is some puppies resist solid food at weaning.

Treatment

For years, farmers & ranchers have used a high-energy, highly digestible protein supplement such as dried bovine colostrum or colostrum whey to start new born animals. Research shows colostrum provides growth factors; free amino acids and calories which stimulate the appetite and help the puppy make the switch to solid food. Using NurseMate™ will also help treat gastrointestinal infections.

NurseMate™ ASAP comes in an economical syringe form. The 15cc syringe can feed up to 7 pups. Syringes are shipped 12 per case.
